

ABSTRACT
DIARY-MESSAGE SYSTEM

A computer diary message system, includes data input means for entering data blocks relating to an event in respect of a plurality of predefined data records; means for generating and storing a first representation of each formed data block combined with an original date. The stored data blocks are attached to the predefined data records as a diary record. The diary records associated with each predefined data record are displayed and messages relating to diary records are created and sent to users of the system where they are displayed for the recipient. Predefined data records to which the diary message relate are accessible in order that the message can be acted on.
